

Day 4 - Lightning Web Components (LWC)

Written Answers

1. What is Lightning Web Components (LWC)?

Lightning Web Components (LWC) is a modern Salesforce framework used to build fast, reusable, and responsive user interface components using HTML, JavaScript, and CSS.

2. Why did Salesforce introduce LWC?

Salesforce introduced LWC to improve performance, use modern web standards, and simplify component development.

3. Difference between LWC and Aura Components?

LWC uses modern JavaScript, is faster, easier to learn, and based on web standards. Aura uses the Aura framework, is comparatively slower, and more complex.

4. What are the three main files in an LWC?

HTML (User Interface), JavaScript (Component Logic), and JS-Meta XML (Component Configuration).

5. Why is JavaScript required in LWC?

JavaScript is used to store data, handle button clicks, perform calculations, and control component behavior.

6. What is Data Binding?

Data Binding is the process of displaying JavaScript data in HTML using curly braces { }.

7. Can LWC directly execute SOQL?

No. LWC cannot execute SOQL directly. It uses Apex to access Salesforce data.

8. Why does LWC need Apex?

Apex is used to retrieve, insert, update, and delete Salesforce records.

9. Where can an LWC component be deployed?

An LWC can be deployed on App Pages, Home Pages, and Record Pages.

10. Explain the component you built today.

I built a Placement Portal Lightning Web Component that displays student details, placement statistics, a welcome message button, and an Apply button that changes the status from Not Applied to Applied.
